

$$\partial_t \mathbf{U} = \underbrace{-\partial_i \mathbf{F}^i(\mathbf{U})}_{\text{no rígido}} + \underbrace{\mathbf{S}_{\text{rig}}(\mathbf{U})}_{\text{rígido}}$$

El paso de tiempo lo fija la advección ( $\Delta t \propto \Delta x$ ),  
no la rigidez resistiva ( $\Delta t \propto \Delta x^2$ ).
